La fauna silvestre en un clima cambiante

Esta publicación examina las consecuencias probables del cambio climático en la fauna silvestre, incluyendo la alteración de ecosistemas y la composición de especies y la mayor incidencia de conflictos entre los seres humanos y la fauna silvestre, incendios forestales y la dispersión de especies invasoras y enfermedades infecciosas. La publicación se centra en la fauna terrestre tropical y sus hábitats, pero también se analizan otros ecosistemas de fauna y otras regiones geográficas. Además, se analizan las respuestas adecuadas al cambio climático; entre ellas, el mantenimiento de los ecosistemas existentes, el manejo adaptativo, la restauración de ecosistemas y la adopción de enfoques integrados y de paisajes para la conservación de la biodiversidad. Para ilustrar los temas discutidos, se ofrecen estudios de casos a lo largo de todo el libro.
