

Desert Locust risk maps - 2015

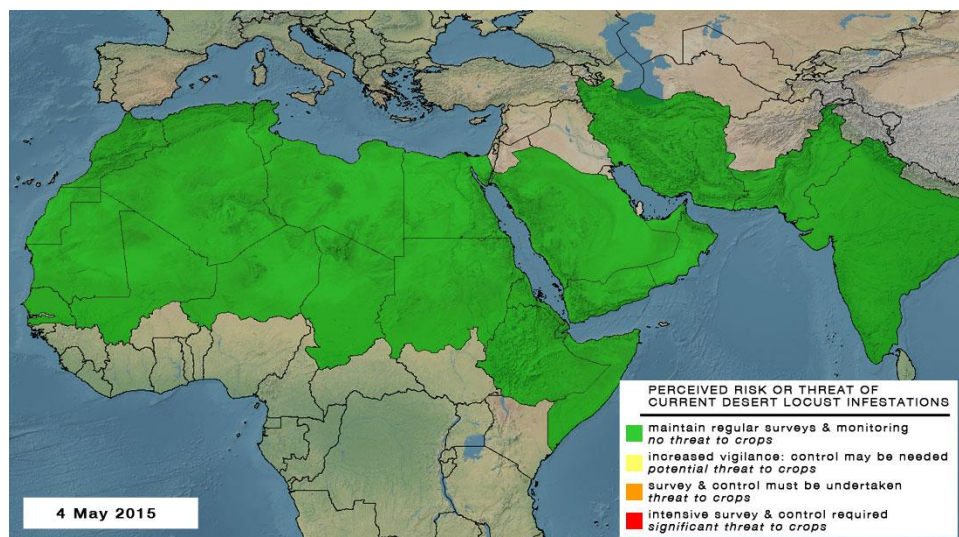

2 October. Threat level increased to CAUTION

Due to the possibility that more locusts may be present in the summer breeding areas of the northern Sahel between Mauritania and Sudan than reported by survey, the risk that small groups could form as vegetation dries out, and potential movements from summer breeding areas to autumn/winter ones, the risk level has shifted from CALM to CAUTION for Mauritania, Mali, Algeria, Western Sahara, Niger, Chad and Sudan.

4 May. Desert Locust situation returns to calm

With the end of the winter breeding and very little spring breeding so far, the situation has returned to normal.

3 March. Desert Locust threat continues in Sudan

Adults groups and swarms that move into the Eritrean Highlands and Nile Valley in northern Sudan pose a threat to crops.
